FOREWORD

This report documents the work performed during the Nozzle Performance Tests (Task III) of Contract NAS3-20061. Because of the large amount of information, this report is presented in three Volumes to facilitate its use.

Volume I contains the design layouts and detailed design drawings of the nozzle models.

Volume II contains the tabular aerodynamic data generated in this program.

Volume III contains a graphical presentation of the data.

11

A complete description of the test hardware and test facilities is contained in the companion Task III Final Report, CR-159818. Significant test results and conclusions are also included in the Final Report.

5.	Tabulated Data	•

1. Introduction

Tabulated aerodynamic data presented in this volume were acquired during $\sin \varepsilon$ scale model nozzle performance wind tunnel test.

Section 2 contains an index that can be used to locate the tabulated data obtained during this program.

Section 3 provides a description of the tabulated data parameters.

The aerodynamic data presented in Section 5 include:

- o Nozzle thrust coefficient parameters
- o Nozzle discharge coefficients

o Static pressure tap measurements

2. Tabulated Data Index

The tabulated data are organized by run number sequence with each run number representing a specific test configuration. Each run is comprised of a sequence of reading numbers that represent specific data points for discrete nozzle operating conditions and tunnel Mach number.

A data matrix is provided in Table 2-I which relates each test configuration and nominal Mach number to the corresponding run number and reading numbers comprising that run. For example, to locate the data for the short flap nozzle subsonic cruise configuration C_2 tested at an ejector inlet position of 0.46 and clamshell angle of 17° at 0.9 Mach number, we find the desired run number is 30 and the reading numbers are (1718-1751).

3. Data Identification Guide

THE RESIDENCE OF THE PARTY OF T

A set of tabulated data for each run consists of tunnel Mach number, nozzle operating conditions, discharge coefficients, thrust coefficients and surface static pressures. The nozzle operating conditions and performance coefficients for each reading of the run are summarized at the beginning of the data set followed by static pressure measurements for each reading. We will use the data set for run 30 listed on pages 585-619 book 2 and previous identified in the data matrix, as an example, to describe the information presented. The configuration description is listed at the top of the summary page. Directly below the description, the nozzle operating conditions and coefficients are tabulated by reading number (RDG) which appears on the extreme left of the page. Proceeding from left to right the parameters are; tunnel Mach number (MO), fan-to-primary stream pressure split (PTF/PTP), fan nozzle pressure ratio (PTF/PO), primary nozzle pressure ratio (PTP/PO), secondary flow (OMEGA), secondary-to-fan total pressure pumping characteristic (PTS/PTF), (note that the secondary flow and pumping characteristic parameters only apply to the supersonic cruise configuration), fan nozzle discharge coefficient (CDF), primary nozzle discharge coefficient (CDP), nozzle gross thrust coefficient as defined in Ref. 1, but including the external skin friction drag of the model (CF1), nozzle efficiency coefficient as defined in Ref. 1. but including external skin friction drag (ETA1), nozzle efficiency coefficient as defined in Ref. 1 (ETA1, INT), nozzle gross thrust coefficient as defined in Ref. 1 (CFP1), nozzle gross thrust coefficient as defined in Ref. 1, adjusted for the estimated internal duct friction losses from the charging station to nozzle exit plane (CFP2), stream thrust coefficient (F9). The definition of the additional thrust parameters not included in Ref. 1 are provided on page viii.

Following the run summary the model surface static pressure measurements are presented for each reading. These data are identified by the run and reading (RDG) number on the upper right hand corner of the page. The pressure measurements are grouped together for each model surface as identified by the heading such as; primary plug, flow splitter outer diameter, flow splitter inner diameter. Reading from left to right for each grouping the pressures are expressed in terms of absolute pressure, psia, (PL), normalized by ambient pressure (PL/PO), normalized by fan total pressure (PL/PTF), and normalized by primary total pressure (PL/PTP). (X/DMAX) describes the normalized axial location of each tap relative to the common model connection flange*. It should be noted that not all of the static tap instrumentation listed was applicable to all of test configurations. For cases that do not apply, the information is lined out.

*For the short flap nozzle configurations C_2 , C_3 and C_{33} , the correct axial location (X/Dmax) of the last inlet flap tap, #48, identified as AVD word 142 is 0.558 and not 0.588 as shown.

Additional Thrust Parameters

Gross thrust coef. CF1 =
$$\frac{(F-Dex)-Dsm}{m_f V_{if} + m_p V_{ip}}$$

Efficiency coef. ETA1 =
$$\frac{(F-Dex) - Dsm}{m_f V_{if} + m_p V_{ip} + m_s V_{is}}$$

Gross Thrust Coef. CFP2 =

$$\frac{F - Dex}{m_f V_{if} + m_p V_{ip}} + \frac{\Delta C_{fp_f} m_f V_{if} + \Delta C_{fp_p m_p V_{ip}}}{m_f V_{if} + m_p V_{ip}}$$

where
$$\Delta Cfp = \begin{bmatrix} \frac{\gamma-1}{2\gamma} \\ \frac{P_t}{P_0} & \frac{\gamma-1}{2} - 1 \end{bmatrix} = \begin{pmatrix} \Delta P_t \\ P_t \end{pmatrix}$$

and $\frac{\Delta P_t}{P_t}$ is the estimated duct friction loss from the instrumentation charging station to nozzle exit plane

Stream thrust Coef. F9 =
$$\frac{(F-Dex) + P_0 A_9}{P_{tf} A_f + P_{tp} A_p}$$
